ACTIVITY ANSWER SHEET

Name	Oliver Vincent G. Fernandico
Section:	R1

Instructions:

- Push your output on your GITHUBrepository.
 Use the answer sheet provided saveit as PDF file then push it to your GitHub.
 Answer the ff. problems write it on the answer sheet.
- 4. Late submissions will no longer be accepted.
- 5. Caught copying outputs of others will be given sanctions.
- 6. Failure to follow these instructions will be given sanctions.

Activity 1: Control Structures

1.Write down the syntax in PHP for the ff.

Tivino devii ale cyliax ii	
1. if	<pre>if (condition) { code to be executed if condition is true; }</pre>
2. ifelse	<pre>if (condition) { code to be executed if condition is true; } else { code to be executed if condition is false; }</pre>
3. ifelse ifelse	<pre>if (condition) { code to be executed if this condition is true; } else if (condition) { code to be executed if first condition is false and this condition is true; } else { code to be executed if all conditions are false; }</pre>
4. switchcase	switch (n) { case label1: code to be executed if n=label1; break; case label2: code to be executed if n=label2; break; case label3: code to be executed if n=label3; break; default: code to be executed if n is different from all labels; }
5. for loop	for (init counter; test counter; increment counter) { code to be executed for each iteration; }
6. do while loop	do { code to be executed; } while (condition is true);
7. while loop	while (condition is true) { code to be executed; }
8. foreach loop	foreach (\$array as \$value) { code to be executed; }

```
jump statement;
9. break statement
                          break;
                          jump-statement;
10. continue statement
                          continue;
                          <?php
                          function checkNum($number) {
                            if($number>1) {
                             throw new Exception("Value must be 1 or below");
                           return true;
                          //trigger exception in a "try" block
11. try...catch
                          try {
                           checkNum(2);
                           echo 'If you see this, the number is 1 or below';
                          catch(Exception $e) {
                           echo 'Message: ' .$e->getMessage();
                          ?>
```

2. Solve the ff. problem using PHP.

a. Write a program that checks if value is a number (integer).

Sample input: '1' Sample input: 1

Expected output: Not a number Expected output: A number

```
<?php
if ( (int) '1' !== 1 ) {
    echo 'not a number';
} else {
    echo 'a number';
}</pre>
```

b. Write a program that checks if a value is positive or negative and odd or even. Sample input: 0 Sample input: -1

```
<?php
function oliver($number){
  if(\frac{1}{2} = 0)
    echo "Even ";
  else{
    echo "Odd ";
function vince($number){
  if(\text{number} >= 0){
    echo "and Positive<br>";
  else{
    echo "and Negative<br>";
  }
number = 0;
oliver($number);
vince($number);
number = -1;
oliver($number);
vince($number)
?>
```

c. Write a program that checks if a value is palindrome.

Sample input: Anna Sample input: Bogart

Expected output: Palindrome Expected output: Not a Palindrome

```
<?php
function Palindrome($number){
  $oliver = $number;
  vincent = 0;
  while (floor($oliver)) {
     $d = $oliver % 10;
     $vincent = $vincent* 10 + $d;
     $oliver = $oliver/10;
  if ($vincent== $number){
     return 1;
  else{
     return 0;
}
sample_ = 1441;
if (Palindrome($original)){
  echo "palindrome";
else {
echo "not a palindrome";
?>
```

d. Write a program to calculate and print the factorial of a number using a for loop.

Sample input: 4

```
Expected output: 24
```

```
<?php
$o = 4;
v = 1:
for($i=1;$i<=$n-1;$i++)
x^*=(i+1);
}
echo "The factorial of 0 = v"."\n";
```

e. Write a PHP program to generate and display the first n lines of a Floyd triangle.

Sample input: 3

```
Sample output:
   1
   23
   456
```

```
<?php
echo "";
vince = 1
for (\$o = 1; \$o \le 3; \$o++) \{
  for (\$v = 1; \$v \le \$o; \$v++) \{
     echo $vince . " ";
     $vince++;
     if ($v == $o) {
       echo " ";
echo "<br/>";
  }
}
echo "";
?>
```

Activity 2: PHP Built-in Functions

Write down the functionalities of the ff. built-in functions in PHP.

Activity 3: Regular Expression

1. Define Regular Expression (RegEx) and provide example programming scenario where you can use (RegEx). Provide example syntax in PHP.

Regular expressions are powerful pattern matching algorithm that can be performed in a single expression. Regular expressions use arithmetic operators such as (+,-,^) to create complex expressions. RSSegular expressions help you accomplish tasks such as validating email addresses. IP address etc.

```
<?php
$pattern = "/ca[kf]e/";
$text = "He was eating cake in the cafe.";
if(preg_match($pattern, $text)){
    echo "Match found!";
} else{
    echo "Match not found.";
}
?>
```

- 2. Solve the ff. problem using Regular Expressions.
 - a. Write a PHP script that checks if a string contains another string

Sample String: 'The quick brown fox'

Test input: 'Fox'

Expected output: Fox is found the string

```
<?php
$vincent = '/[^\w]fox\s/';
if (preg_match($pattern, 'The quick brown fox'))
{
  echo "Fox doesn't found the string"."\n";
  }
  else
  echo "Fox is found the string"."\n";
  ?>
```

b. Write a PHP script that removes the last word from a string.

Sample String: 'The quick brown fox'

Expected output: 'The quick brown'

```
<?php
$vincent = 'The quick brown fox';
echo preg_replace('/\W\w+\s*(\W*)$/', '$1', $vincent)."\n";
?>
```

c. Write a PHP script to remove nonnumeric characters except comma and dot. Sample String: /\\$123,34.00A#' Expected output: 123,34.00

```
<?php
$vincent = "$12,334.00A#";
echo preg_replace("/[^0-9,.]/", "", $vincent)."\n";
?>
```

d. Write a PHP script to extract text (within parenthesis) from a string.Sample String: 'The quick brown [fox].'Expected output: Fox

```
<?php
$vincent = 'The quick brown [Fox].';
preg_match('#\[(.*?)\]#', $vincent, $match);
print $match[1]."\n";
?>
```

e. Write a PHP script to remove all characters from a string except a-z A-Z 0-9 or " ". Sample String: 'abcde\$ddfd @abcd)der]'
Expected output:abcdeddfdabcd der

```
<?php
$oliver = 'abcde$ddfd@abcd )der]';
$vince = preg_replace("/[^A-Za-z0-9 ]/", ", $oliver);
echo ".$vince."\n";
?>
```

Activity 4: Error Handling

```
1. List down the different PHP errors. Provide example code on how to handle these errors.
E ERROR
E WARNING
E_NOTICE
E USER ERROR
E USER WARNING
E_USER_NOTICE
E_STRICT
E_ALL
<?php
function customError($errno, $errstr) {
 echo "<b>Error:</b> [$errno] $errstr<br>";
 echo "Ending Script";
 die();
}
set_error_handler("customError",E_USER_WARNING);
$test=2;
if ($test>=1) {
 trigger_error("Value must be 1 or below", E_USER_WARNING);
?>
```
